tertiary Oct 29, 2016 I'm not sure what I'm doing wrong. Please let me know if I need to provide more information. A: Does your text file with the "tags" data have a.txt suffix? For example, can you run this command: ls when you are on a linux box, the result should be something like: txt folders pics Scripts Videos and not: ls This would suggest that it is a file type that is not being interpreted by default. Q: In Linux, how can I change the date format in console output? In Unix, you can set the date format for when a command is run using date: date date-string For example, to get the current date in this format: Wed Jan 15 09:33:20 2019 you can run the command: date "+%A %B %d, %I:%M:%S %Z" How can I do this in Linux? I am using CentOS 7. A: Try this simple alias: alias date='date -r' %r is like %d, %D and shows time as well: %r 2012-01-10 01:20:30 +0000 Edit: To format the date and time as specified, use: date +%A %B %d, %I:%M:%S +%Z Determining the effects of the staff presence during observation on error rate and effectiveness of staff during skin and mucous membrane testing. The aim of this study is to investigate the effects of the staff presence during observation on the outcome of the testing process. We conducted a two-week experimental field study on a university hospital outpatient department. The testing methods included skin and mucous membrane testing. Four staffs were assigned to either the staff-observation or the no-staff group. The staffs were asked to detect the presence or absence of tactile defensive behavior (TDB) from the tester and to note it in a record sheet. The response to the testing was recorded by one of the researchers who was present. A sample of patients was selected and the data were analyzed. The response rate of TDB to the testing ranged between 20.0 and 33.3% across the months.
