Get the jagged alliance back in action trainer 1.13g, jagged alliance back in action v1.0 trainer and. jagged alliance back in action trainer v1.13g.Q: How to properly set the security level of a domain in Oracle? To make sure that my website is safe for the public, I have set the security level of my database to medium. It means that data are more secure, but also that queries, stored procedures, functions etc. are slower. But how to set the security level of a domain? If I create a user with this statement: create user myuser identified by password'mypass'; then all functions that use it will get a nice security level. But will that really increase my security? I would expect that it is the other way around, that a domain with a medium security level protects against attacks of all kinds. A: The security of the Oracle database is independent of the security of the domain; it is global. All users, functions, packages, schemas, etc. have the same security and it is part of the security of your database. If you want to secure your application, that means using stored procedures that don't allow access to sensitive information to the user and don't execute dynamic SQL. Only if you do that can you be sure that no matter what user happens to connect to your database, he will not get any privileges. Q: Problem with an nVidia Quadro P2000 I have a problem with an old nVidia P2000 card. After compiling the kernel 2.6.28.12 for my system (a core duo), I have problems with Xorg. The display manager does not start and I have a black screen. If I use xorg.conf, I have a blank screen, if I use nvidia.conf, my screen does not come up at all. If I use nvidia-xconfig it says that the configuration file was not generated because the directory /usr/share/X11/xorg.conf.d does not exist. In the nvidia.conf file, I have just changed "Load Module "fbdev" " to "Load Module "nvidia" A: 2d92ce491b
