The Free Digital Clock is a desktop application which displays the current time in digital format in a small, moveable window. The design is very simple - it consists of a digital clock and a window which shows the current time. DigitalClock doesn't try to compete with other calendar programs (it doesn't even have a calendar) Instead, DigitalClock was created to be a simple and clean clock. It can show the date, the time and the day of the week. DigitalClock has a simple look with black and grey color scheme. If you need more information, the Free Digital Clock FAQ can be found here: . The DigitalClock can play sounds on a timer. Simply create a file containing a list of sounds in the format (for example, "background.wav" or "alarm1.wav") and add it to DigitalClock's "music" folder. This feature is especially useful for creating a "timer" function. For example, you can play a sound every 10 minutes, or every 20 seconds. As a result, the user will not hear a sound if the timer is running. Instead, a sound will be played when the timer ends. For more information, refer to DigitalClock's documentation. Here is an example configuration file. You will notice that the examples are incomplete. For example, there is no indication of what music folder is created. Additionally, the volume for the music file is left unconfigured. This is because I didn't find a volume option. I guess that this can be done via another property, but since there is no clear indication of how to configure the program, I decided not to add it. You can add an example configuration file to DigitalClock in order to help other users who want to modify the file. The latest version of DigitalClock is available here: . DigitalClock can be compiled for Win32 platforms using Microsoft Visual C++ 2005. You can use this binary on your PC or laptop, but it is not optimized for use on embedded systems, like mobile phones. More info can be found in the documentation. Compilation instructions: Please follow
