Liquefaction of sulphur-rich sponge-like iron pyrite. Sulphur-rich sponge-like iron pyrite (SPF) are high-temperature iron sulfide formations that show a wide range of characteristics depending on their original geology. The overlying geothermally heated formations of a hydrothermal sulfide deposit, an eclogite contact and a gneissic intrusion can be distinguished based on their mineralogy and mineral chemistry. While using microprobe analysis, we show that the central layers of the hydrothermal sulfide deposit contain a mixture of low-temperature sulfides with a composition and a texture identical with the original pyrite. The external layers of the hydrothermal sulfides which were exposed to a higher temperature, however, display a microstructure of a more disaggregated/freeze-dried matrix with a higher iron(II) and/or molybdenum(VI) content. The microstructure and chemistry of the microprobe analyses of the gneissic intrusive contact from a previous study were also re-evaluated. It has previously been reported that these samples contain natural pyrite with a bulk composition similar to the original pyrite. However, the microprobe analyses show that the pyrite has undergone a post-growth modification with a higher iron(II) and/or molybdenum(VI) content. Despite the different environmental conditions during the formation of SPF, the sulfide of the hydrothermal sulfide deposit, gneissic intrusive contact and eclogite formation share a high-temperature, post-growth (precipitation) modification of original pyrite. In the interest of full disclosure, there are certain resources which I work with closely that the following review

I want to record some instruments and for some of them, I want to save the settings and then load the saved files with those instruments. And I have question how to manipulate the.wav files? Can I modify a wav-file with some settings in NI-VC 160 or with some other applications? . Native Instruments – VC 160 1.0.0 VST.RTAS.AAX x86 x64. VST x86 x64 Windows. Thanks for all.
