I am using an encryption key that I would like to have the same type on the other end (whoever will decrypt the file). Is it ok to use the same algorithm or does it need to be the same type? A: From a practical standpoint, the encryption algorithm does not have to be the same on both ends. The same encryption key can be used to encrypt two files, provided they are stored using different algorithms. This invention relates to the field of fluid separation. More particularly, it relates to the separation of a relatively pure component from a mixed component stream of gases. Fluid separation by pressure swing adsorption (PSA) is based on the phenomenon of differential adsorption of gases and is described in U.S. Pat. No. 2,958,656. PSA relies on the fact that different gases have different adsorption affinities for an adsorbent, and that therefore under pressure variation, gases are adsorbed at different rates in a packed bed of adsorbent. A key component in a PSA cycle is a swing adsorption (SA) or vacuum pressure swing adsorption (VPSA) unit which consists of an adsorbent bed packed with a mixture of adsorbent and adsorbate under pressure, and a vacuum system. For a given feed, when the pressure is reduced to a value below the adsorption pressure of the adsorbent, the lightest component is desorbed and is collected while the remaining gas stream is returned to the feed side of the bed. Thereafter, the bed is repressured above the adsorption pressure and the adsorption cycle is repeated. As used herein, the term "adsorbent" refers to a material that adsorbs gas from a feed gas. Adsorbents are known in the art. For example, an adsorbent used in the separation of sulfur from coke oven gas is calcium or barium sulfite (U.S. Pat. No. 2,958,656). Further examples of adsorbents are ones that include sulfates and carbonates of zinc and alkali.

I'm using list comprehension to build a list of functions; it looks like this: `import string import operator fns = [f for f in string.ascii_lowercase if f not in 'aeiou'] + [f for f in string.ascii_uppercase if f not in 'AEIOU'] + [f for f in string.digits if f not in 'aeiou'] + [f for f in string.punctuation if f not in 'aeiou'] + [f for f in operator.add if f not in 'aeiou'] + [f for f in operator.sub if f not in 'aeiou'] + [f for f in operator.mul if f not in 'aeiou'] + [f for f in operator.div if f not in 'aeiou']` Traceback (most recent call last): File "number_associativity_calculator.py", line 10, 3e33713323
