Renal pelvic tumors: is vesicoureteral reflux a prognostic factor? Vesicoureteral reflux has been considered to be a prognostic factor for the development of recurrent renal pelvic tumors. We examined whether the presence of vesicoureteral reflux is correlated with the incidence of local recurrence and metastasis in patients with transitional cell carcinoma of the renal pelvis. The study group consisted of 124 patients (group 1) with transitional cell carcinoma of the renal pelvis treated by nephroureterectomy from 1971 to 1992. An age- and gender-matched group of 124 patients with similar pathologic findings (group 2) was used as the control. Vesicoureteral reflux was found in 60 of the 124 patients (48%) in group 1. The mean follow-up period was 6.7 years. Of these patients, 34 (55%) had localized recurrence. Renal pelvic tumor-related death occurred in 5 of the 60 patients (8.3%). The incidence of distant metastasis was 7.7%. Vesicoureteral reflux was identified in 12 of the 60 patients (20%) in group 2. The mean follow-up period was 7.1 years. Of these patients, 4 (33%) had localized recurrence. None of the patients in group 2 developed distant metastasis. This study failed to show a statistical significance between the incidence of renal pelvic tumor-related death and the incidence of metastasis between group 1 and group 2. Vesicoureteral reflux may not be correlated with the incidence of local recurrence and metastasis. The presence of vesicoureteral reflux was not an independent prognostic factor for the development of renal pelvic tumor-related death.

Binocular organization in the inferior temporal cortex in the cat. In the cat, cells in a small region of the inferior temporal cortex (area 37) respond to visual stimuli presented to one or both eyes. One

What's New in the?

Network Spy is a lightweight Windows application designed to help administrators collect network information, capture packets, and perform debugging operations. It sports a clean and straightforward interface that allows users to perform most operations with just a few clicks. Network Spy lets you gather useful data (e.g. throughput, peak throughput, packet count, bytes, elapsed time) about remote hosts, provided that you have specified the IP address, login, and username. What's more, you can play or stop the recording process, clear the information from the main pane, decode the selected packet, choose the adapters, and apply filters to get notified where critical events are found on the system. Other important features worth mentioning enable users to resolve IP issues, configure port settings, as well as enable the logging process and specify the saving directory and file format. Last but not least, you can perform WHOIS operations for finding information about domain names and IP addresses, use the Ping option for testing the reachability of a host on an Internet Protocol network, as well as use the diagnostic tool to view the route and measure the transit delay of packets. The generated information can be printed or exported to NSS file format. Since there aren't many configuration settings, even less experienced users can master the entire process with minimum effort. During our testing we have noticed that the tool carries out a task quickly, and no errors showed up throughout the entire process. It manages to remain light on the system resources, so it doesn't burden the overall performance of the computer, nor interfere with other programs' functionality. To sum things up, Network Spy offers an intuitive layout for helping you perform useful network operations and is suitable especially for rookies, as it lacks advanced features.
