MTA has many useful features, but I am finding it cumbersome to use. I prefer TICTAB. Is there anything that I can use to achieve the same functionality, with the same user interface? I want something simpler. (Review by lil-seraph) (Closes: #84263) Submitted by Anonymous (anonymous) on 2014-03-26T11:13:35Z. I downloaded MTA from an old Sourceforge website to try it out, and all I got was a console window with a list of system objects. Does MTA have any GUI tool? The main idea is to enable the user to display and modify some system properties, such as all open windows, processes, threads. It's written in C, and its configuration file can be edited with a text editor. The source code, build and install instructions are in the project's readme.txt file. I have included a snapshot of the first configuration file created with an Emacs Lisp mode. I hope it will be useful to some of you. What's New In Sysview?

SysView has been written from scratch to be a standalone GUI application that will make it easy to access and modify System-related properties like memory, file descriptors, network ports, and threads. In this version we have improved the GUI (mainly the menus) and added a general memory analyzer. sysview includes the following: * Full screen capture * Basic process viewer * Full system property viewer * RAM memory viewer * Process ID and module viewer * Process "*" viewer * Thread viewer * Thread "" viewer * Control panel with advanced options (like viewing process by PID) * Color control * Color panel * SysTray icons * Settings and configuration dialog * Conversion from CPU MHz to GHz SysView is a freeware tool that is freely available for all Windows OSs, including Linux, Solaris, BSD, and so on. The source code is also freely available to all under a GPL license. In this release we have added the "x86-64" format to most of the analyzers. Please be aware that this change might make some executables crash due to it being a 64 bit application. Please upgrade your system before trying this version. If you have any bugs to report or suggestions about the software, please email us at: support@sysview.orgQ: PhpStorm cannot resolve project dependency, as Eclipse can I just installed PhpStorm and used it to set up a small new project and it worked just fine. Then I added a library project to the same project and then when I tried to resolve the project's dependencies I get: "cannot resolve module'my-project-dir/vendor/autoload.php" When I open the library project and go to file -> Settings -> Project: [Module Project] ->.project, then click the box next to autoload.php and the only option is my-project-dir. This is different than how I have been using the library in Eclipse. In Eclipse I have no such problems. Is there any way to make PhpStorm use the same settings as Eclipse? I have already tried to use Update Dependencies from the menu, but it didn't work. A: I solved it by setting the following in the Project Settings -> Module Settings -> Libraries -> Paths and Interpreter Options: {\$basePath}/{\$module_path} As I see it in the screenshot, the PhpStorm ignores any content inside curly braces {...} in the path as shown above. If the same issue occurs again, then please report it on JetBrains bug tracker. (The PhpStorm is released under AGPLv3
