**Adobe Photoshop Elements 8.0:** It's a digital photo editor and an overall organizer for image management. It has a limited set of artistic tools.

**Adobe Photoshop Express (app):** Good for basic editing of digital photos and for making money by selling them on Facebook.

**Adobe Photoshop:** The premier graphics design application. For simple tasks it's a viable tool; for complex editing tasks, use a graphic design application.

**Adobe Photoshop Lightroom:** This application serves as a bridge between image files and your camera. As such, it functions as a preprocessor and organizer for images captured with your digital camera or imported from a memory card or disc. Lightroom also lets you do basic editing of images, as well as batch processing of multiple files. Unlike Photoshop, Lightroom is optimized for editing images taken with a digital camera, rather than images imported from a disc or camera card. (You also use Lightroom as a way to view images from your camera.)

**Adobe Photoshop Express:** Designed for simple basic photo editing and other capabilities, it's almost as good as using the built-in Camera Raw feature on the Photoshop CS6 and earlier programs.

### Adding Text and Text Styles Creating any kind of text using a graphics program is a snap. Just choose the tool of your choice to get started and pick a font. In Photoshop, you have several options for text, including

**Basic text:** A simple, flat-shaded typeface.

**Outline text:** A standard text outline with shadowed areas and a two-tone background.

**Diffuse text:** A highly textured and complex alternative to outline text.

**Blends (shadows, type, and image textures):** Shadow areas and effects that you can assign to different parts of text in a graphic. You can apply these effects to any type of text, but they work best with outlines and diffused text. Figure 2-1 demonstrates the variety of text options available in Photoshop. **FIGURE 2-1:** Each type of text is available in Photoshop as a typeface, outline text, or text with shadows and blurring. You can also add and adjust the appearance of text in a photo, as shown in Figure 2-2. **FIGURE 2-2:** Use the type tool to add text to a

Q: Detecting Key Press before changing Border of Image I am using the solution shown here: Detecting Key Press before changing Border of Image to detect key presses and change border of an image. However, instead of a border, I would like to change an image that has a border for a given time period. I would like to change the border of the image from a solid to a dashed or dashed to a solid and have the border of the image change a few seconds after I press the key. One of the examples in the link above is: `int[] downKeys = new int[10]; System.Windows.Forms.Timer timer = new System.Windows.Forms.Timer(); timer.Tick += new System.EventHandler(this.upDownGenerator); timer.Interval = 1000; private void upDownGenerator(object sender, EventArgs e) { if (KeyDown(Keys.Left)) downKeys[0] = 1; else if (KeyDown(Keys.Right)) downKeys[1] = 1; else if (KeyDown(Keys.Up)) downKeys[2] = 1; else if (KeyDown(Keys.Down)) downKeys[3] = 1; else if (KeyDown(Keys.Space)) downKeys[4] = 1; if (downKeys[3] == 1) { this.image1.BorderStyle = BorderStyle.Fixed3D; timer.Stop(); timer.Start(); } }` Is there some way I can use this code, but instead of `downKeys[3]` I can use `downKeys[0]` and instead of `downKeys[3]`, I can use `downKeys[1]`, and instead of the hard coded `image1`, I can use my `Border image`. I tried using `this.image1.BorderStyle = BorderStyle.Fixed3D;` in a `Button_Click` event handler and when the image changes, nothing happens.

Q: rails 3.1 / HAML and generated output returning an error I am trying to implement a search feature in my rails app, and I can't seem to get it to work. My controller method for searching is set up as follows `def search @content = Content.find(params[:q]) @categories = Category.find(params[:category]) search_links = Array.new if params[:search] @search_terms = params[:search].split(',').map{|s| s.strip.downcase} @categories.each do |c| c.name.each do |s| if s =~ @search_terms search_links.push() puts "test" end end end render :layout => true, :layout => "layouts/main", :template => "home/home", :content_type => "application/json" else search_links.push() render :layout => false, :layout => "layouts/main", :template => "home/home", :content_type => "application/json" end end` And here is the error I am receiving in my terminal `test /home/home.haml:74: undefined method `[]' for :categories:Symbol /home/home.haml:94: undefined method `[]' for []:Array` I tried a few other things but to no avail, I am not sure what I am doing wrong or if this is related to the fact that I am generating the output with haml. Here is my `home.haml` file `%header = link_to "Home", "/" = render :template => "layouts/todays_pull_tab"`
