Do you know what will happen after the end of support for Windows XP? The answer is: exactly nothing. In other words, Microsoft will stop releasing security updates for the next Windows operating system, even though it will continue to sell support. That means that there will be no new bugs will be discovered, and after March 8, 2017, there will be no response from Microsoft at all. Things are still a bit more complex with Windows 10, though. Despite the fact that the operating system will reach its end of life on January 14 2020, Microsoft has promised to continue to release new updates and even security patches until then, albeit for a limited time. This means that regular security updates will be issued on the last six months before the end of support period, with all of them being released for 18 months after. There are also occasional preview releases, the final version of which will remain free until the end of time, and the less essential updates will be offered for a fee. This is by no means a confirmed plan, though, and many security experts are still doubtful that this is the final Windows 10 version. Once support for Windows XP has ended, Microsoft will make sure that Windows 10 will work just fine for as long as possible, and so users should be wary of putting their data at risk. Even though Microsoft will finally stop accepting additional features, there will be occasional betas, so users should be prepared to test it out before the final release. However, even if you were brave enough to install Windows 10 now, it will still be a better option to wait until the end of time for the final version. Not only are there plenty of security and stability issues, but the operating system is still a bit too complex. While
