WATADIAG uses Windows API (WUDF) to read and write ATA-3 and ATA-4 formatted disk sectors. WATADIAG is built on DOS and uses the original FAT API, just as the DOS version of WUDF. It is written in Turbo Pascal/Delphi to provide a very fast and reliable ATA sector scan and drive information utility. WATADIAG is an extremely powerful utility, more so than a typical DOS version of the ATA/IDE API. At its core, WATADIAG provides a comprehensive ATA sector scanner with the following unique features:

- ▣ Up to 20 readable drive surfaces per drive supported (40 for dual-sided drives)
- ▣ Accurate analysis of the drive surfaces using the Advanced Drive Quality Analysis (ADQ) utility
- ▣ User defined size and sector scan area from disk sectors up to 8kB
- ▣ User defined sector size (any value, default is 4B)
- ▣ The ability to write any sector on any surface (from any drive surface) to any other sector on any other surface of the same drive
- ▣ Ability to read and write sector ranges, to automatically adjust the sector size
- ▣ Ability to write values to non-contiguous sectors, including the ability to write values to user sector ranges
- ▣ Ability to program entire sectors, including a sector size and sector count that was changed, to reflect the new sector size and count

WATADIAG creates an INF file in the /var/log directory which lists all the users who have access to the system. Note: WATADIAG will first clear all the INFs associated with the FAT12 and FAT16 file system, before it is updated to track INFs for any FAT32 file system that has a system drive (such as a Windows hard drive). A Scanner WATADIAG uses the idescan2.0.exe tool to read the ATA registers and any AHCI table it can find. In addition, WATADIAG will also extract any data from the ATA registers and idescan2.0.exe can scan and return most drive information found by WATADIAG. The WATADIAG scanner will also display all drive information found by idescan2.0.exe.
