Trace Route GUI is a program that displays a list of network routers used to make a given internet address connection. There are several reasons people might want to know this information, either to trace a routing problem or to determine how a computer connects to the internet, for example. Trace route's main window contains several tools for use. First, there are three menus of settings, which let you configure Trace Route for the most common use. After you've done that, you can click Trace Route in the top menu to display the screens below. Trace Route will display a list of all routers which have made a connection to the destination specified. Each router's information is displayed in the list, including the number of hops used and the maximum time the router took to go to the destination. A second, secondary page displays information about each router, including the host name, IP address, and maximum number of hops used. For example, if you click the Next button, the router you clicked on will be the first displayed in the secondary page. The last screen displays information about the current connection you are making to the internet. This connection's IP address is displayed, as is the router's host name and number of hops used.1. Field of the Invention The present invention relates to a power supply circuit for supplying a constant DC voltage or a constant DC current to a load. 2. Description of the Prior Art A power supply circuit as shown in FIG. 1 is currently used for supplying a constant DC voltage or a constant DC current to an amplifier or the like. In FIG. 1, an input terminal 1 is connected to a power source through a resistor R2 for generating a constant voltage V.sub.in. A transistor Q2 is connected to the input terminal 1 in series, and a load resistor R3 is connected in parallel to the transistor Q2. A transistor Q1 is connected between the transistor Q2 and a ground, a base of the transistor Q2 is connected to an emitter of the transistor Q1, and a collector of the transistor Q2 is connected to a base of the transistor Q1. A current flowing to the transistor Q1 is supplied to the load resistor R3. A resistor R1 is connected to the base of the transistor Q1, and the resistor R1 is used for stabilizing the transistors Q1 and Q2. A capacitor C1 is connected to a

This is possible by simply inputting an IP address in the appropriate box and clicking the "Trace Route" button. In addition to that, you should know it is possible to adjust the values for maximum number of hops and timeout (expressed in milliseconds), and set up the application to resolve addresses to hostnames. The main window is going to display as a list, all routers reached, along with hop number, host name, IP address and timeout. By right-clicking on an item, you bring up a context menu which lets you copy the selected IP address or host name to the Clipboard for further use or save the settings, so that you can use them at a later date.
