Field of the Invention The present invention relates to a semiconductor memory device, and more particularly, to a synchronous semiconductor memory device and method of operating the same. 2. Discussion of the Related Art A synchronous semiconductor memory device outputs a clock synchronized with an externally supplied clock. The frequency of the externally supplied clock determines the frequency of the clock synchronized with the externally supplied clock. The clock synchronized with the externally supplied clock is used to input, or to output, data. Some synchronous

semiconductor memory devices include a receive clock generation circuit for receiving an externally applied clock and generating a synchronous clock having a different phase and a clock for controlling a data output buffer. In this case, the synchronous semiconductor memory device buffers the externally applied clock using a clock input buffer. The clock buffered using the clock input buffer is then used to generate a receive clock having a different phase and a clock for controlling the data output buffer. Related art synchronous semiconductor memory devices have several disadvantages. One disadvantage is that the circuit overhead and power consumption increase as the number of buffers increase. Another disadvantage is that the signal transition time decreases and the static noise margin (SNM) decreases as the number of buffers increases. Accordingly, it is desirable to develop a synchronous semiconductor memory device with a reduced number of buffers which also has a reduced circuit overhead and power consumption.

Controlling vibration and noise of metallic structures by lithographic nanoimprinting. In this paper, we show the excellent mechanical performance and innovative vibration control of metallic structures by a newly developed nanoimprinting process. We demonstrated that control of the stiffness and damping of arbitrary structures could be successfully achieved by properly choosing the nanoimprinting parameters, including pattern design, imprinting pressure, and imprinting time. In addition, we demonstrated the reduction of vibration and noise of a vibrating plate using nanoimprinted structures as an acoustic-absorbing pad.

Guatemala's new president, Otto Perez Molina, has vowed to stop the practice of "forced disappearances" and said he will be the first head of state in a decade to visit the most dangerous prisons in the country. Molina's visit to the penitentiary where dozens of people have been murdered by gang members and police came amid increasing international concern over
