and colors, Adobe Camera Raw is like a built-in function for Photoshop or a separate standalone application that takes the place of some Photoshop functions. In Camera Raw, you can apply exposure corrections, white balance adjustments, vignette adjustments, color adjustments and sharpening tools, and create a range of creative effects using the filter menu. Adobe Camera Raw is simple to use and can drastically improve your images. A beginner is probably better off using Camera Raw than trying to master Photoshop's various tools, although Photoshop users will enjoy these

Q: Jasper reports: splitting the table to two pages I'm creating a report using the jasper server report. The report should include the following screen: Company Name (should be two columns on one page) Products (should be two columns on another page) Nested tables of products & Company name... And i'm using the following code for page headers.  `${PHD_HEADER_PAGE.getPage(1).printExtra()} ${PHD_HEADER_PAGE.getPage(1).printFooter()}`  The problem is that both the products & company name get printed on the first

---

page. I only want the Products on the first page & company name on the second page.

A: As you are using nested tables, you will need to use 2 tables. Create a table for the products, which is inside the companyName table. Your current code will print headers for the first & 2nd page for the companyName. Similarly, inside the products table, create a table for products. This will allow you to print an extra page for each of the companyName & products table. In the case of companyName and products tables, you won't need a grouping for the grand total. The print of the grand total in both the

tables will be the same. Decomposition kinetics of butylated hydroxyl toluene. The oxidation kinetics of butylated hydroxytoluene (BHT) have been investigated at different temperatures (163-193 K) and relative air humidity (0-70%). The reaction was found to be endothermic at all the temperatures studied. The activation energy of the reaction ( $E(a)$ ) was estimated from the Eyring plot and was found to be 24 kJ mol<sup>-1</sup>. An activation enthalpy ( $\Delta H(int)$ ) of 7.5 kJ mol<sup>-1</sup> was calculated from the temperature dependence of the rate constant ( $k(obs)$ ).

---

The reaction was found to be of a highly associative nature and the observed reaction rate was best described by the Law of Mass Action. Long-term potentiation at central synapses is mediated by the activation of dendritic  $\text{Ca}^{2+}$ /calmodulin-dependent kinase II (CaMKII). Long-term potentiation (LTP) of synaptic transmission can be induced in the central nervous system by theta-

Chronic kidney disease is a major global health problem contributing to morbidity and mortality. While there are many

---

potential causes, chronic kidney disease is strongly linked to hypertension, a major driver of the global burden of disease. Inflammation contributes to the pathogenesis of hypertension and end-stage renal disease. Recent studies show that the innate immune system and inflammation are critically involved in hypertension and chronic kidney disease. In response to hypertension, macrophages are activated in the renal glomeruli. Macrophages are a major source of pro-inflammatory cytokines such as TNF- $\alpha$ , IL-6, and MCP-1. MCP-1 acts as a master regulator of inflammatory processes, recruiting

---

circulating monocytes into the damaged glomeruli. The role of inflammation in hypertension is highlighted by studies showing that anti-inflammatory therapy with corticosteroids or IL-1 receptor antagonists can reduce blood pressure and reverse kidney damage. My laboratory studies the role of inflammation in hypertension using two different models of hypertension: the spontaneously hypertensive rat (SHR) and angiotensin II (Ang II) induced hypertension. In addition, we have developed a novel mouse model of hypertension in which blood pressure can be pharmacologically increased in a

---

controlled manner. These unique models of hypertension have led to the discovery of important new roles for the innate immune system in hypertension. In both models of hypertension, the immune system is activated in the renal glomeruli; we demonstrated that circulating monocytes are the source of the activated innate immune system. We further demonstrated that the ATP diphosphohydrolase (CD39) protects against hypertension, in part through its actions on the innate immune system. CD39 knockout mice (Cd39<sup>-/-</sup>) have higher blood pressures and develop more severe glomerular injury as they age

---

compared to wild type mice (Cd39<sup>+/+</sup>). In addition, CD39 inhibits hypertension and glomerular injury in Ang II-induced hypertensive mice. Based on these exciting new findings, the central hypothesis of this proposal is that CD39 inhibits hypertension and glomerular injury in both models of hypertension, via its actions on the innate immune system. In Aim 1 we will determine the role of CD39 in hypertension. In Aim 2 we will determine the mechanisms by which CD39 inhibits hypertension. In Aim 3 we will determine the role of CD39 in glomerular injury. This work is designed to move the field forward

---

by furthering our understanding of the interactions between the innate immune system and hypertension. Chronic kidney disease is
