Why Should You Get Photoshop Elements? Edit photos The integrated editing tools make it easy to correct common errors. Use the crop, rotate, resize and straighten tools to quickly correct a problem. Using the Adjust tool, you can edit photographs in different ways to enhance and adjust brightness, contrast, color, and whitespace. You can also add special effects like light and dark, set fine details, or adjust levels. Make a standard digital photo The integrated editor tools make it easy to make high-quality images. Use the picture or create a new picture from scratch. You can transform images into black-and-white, sepia, or monochrome. You can adjust the color of the original photo or create a new background. You can use the draw tools to add objects, frames or borders. The new image can be saved as a JPEG file, edited, then saved as a new JPEG file. You can use the built-in filters to improve images with special effects, such as sepia or black-and-white. The new filter can be applied as often as you want. Creating a standard digital photo You can use the integrated editor tools to make a standard digital photo. Use the effects, add borders, and adjust colors or brightness levels to make a complete picture. The new image can be saved as a JPEG file, and you can use the built-in filters to improve images with special effects, such as sepia or black-and-white. The new filter can be applied as often as you want. Add text and graphic elements It's easy to add text or graphic elements with the new image editor. Use the font, alignment, and text color tools to make text, logos or other details look great. You can also apply filters and draw objects on the image. Add text or graphic elements You can add text and other graphic elements to the image. Use the font, alignment, and text color tools to make text, logos or other details look great. You can apply filters and draw objects on the image. The new filter can be applied as often as you want. Create a custom graphic The new image editor makes it easy to create custom graphics. Use the shape, line, and text tools to draw directly on the image. Or you can start with a blank

Q: How to find all files that are common in two lists? I'm looking to build a function in Python (3.6.0) that will find all files in a directory that appear in both a first list and a second list. Lists are like so, using the directory /home/me/folder as an example:
list1 = ['/home/me/folder/a.jpg', '/home/me/folder/b.jpg', '/home/me/folder/c.jpg', '/home/me/folder/d.jpg',
'/home/me/folder/e.jpg', '/home/me/folder/f.jpg', '/home/me/folder/g.jpg', '/home/me/folder/h.jpg', '/home/me/folder/i.jpg']
list2 = ['c', 'b', 'd', 'a', 'e'] What I'm after is a function that returns the list of all files in directory /home/me/folder that appear in both lists above, /home/me/folder/i.jpg being the only file in the examples above that is not included in list2. A: You can do that by using the set() built-in. First let's make a list of your file paths: filenames = ['/home/me/folder/a.jpg',
'/home/me/folder/b.jpg', '/home/me/folder/c.jpg', '/home/me/folder/d.jpg', '/home/me/folder/e.jpg', '/home/me/folder/f.jpg',
'/home/me/folder/g.jpg', '/home/me/folder/h.jpg', '/home/me/folder/i.jpg'] Use this list as the elements of a set() to create a set that contains the items that are duplicated: filenames_set = set(filenames) Use the list operator | to create a list with all the items from list1 that are also in filenames_set: list1_filenames = list(filenames_set | list1) Check whether any of your elements is in list2: list2 = ['c', 'b', 'd', 'a', 'e'] if any

Q: How to check interface and implementation were loaded by javac from Spring RestTemplate class? Spring RestTemplate is loading instance of com.xxx.ws.ws.WSService interface. I would like to check: If any Spring class was loaded from spring-rest-template.jar. If any implementation of interface from within Spring class was loaded. I need this info in order to generate configuration files for additional classes. A: Here are some snippets from the build.sbt file for Spring-rest-template lazy val restTemplate = ... object restTemplate { val spring = project.in(file("../spring-rest-template-parent")) val springBase = project.in(file("../spring-rest-template-base")) lazy val springRestTemplate = spring In a broad array of fields, including medicine, noninvasive methods of detecting disease have been a very active area of research. There is a broad array of situations in which noninvasive tests of a patient's health have great value. There are a number of current medical uses for noninvasive testing: for example, the detection of oxygen saturation in the blood using pulse oximetry is an important and noninvasive tool used in a wide range of clinical applications, including the monitoring of patients at rest and on an operating table in a surgical setting, and the continuous monitoring of premature infants as they undergo major surgical operations and develop anesthesia and wean from ventilatory support. Other examples of clinical uses include the monitoring of cardiac function during surgery; the continuous monitoring of patients in intensive care units; the monitoring of arterial pressure and cardiac function during cardiopulmonary resuscitation; the monitoring of
