Concrete saws are generally used for cutting concrete and a cutting blade of the concrete saw cuts concrete by rotating in relation to a housing. The rotation may be accomplished using an electric motor. To start the rotation, the motor is first wound up, and when the rotor begins to rotate, power is transmitted to the cutting blade to make the cutting blade rotate. Usually, a rear end of the housing is provided with an automatic stop/brake mechanism, which prevents the housing from moving backward when power is being

transmitted to the motor. The mechanism is released when the motor is running, and a brake moves into a stopping position, in order to prevent the motor from rotating when the motor is stopped. A user may need to perform a number of operations using the concrete saw before the braking mechanism is released, for example to remove the cover from the blade for maintenance. However, once the brake mechanism is released, the concrete saw can be used to cut concrete. However, the cutting blade still continues to rotate after the brake mechanism is released, so that the housing moves forward in relation to the blade, which may be dangerous, especially for persons working near the concrete saw. To the knowledge of the inventor, there is no concrete saw that is equipped with a brake mechanism to reduce the rotation speed of the cutting blade when the brake is actuated. - - 0 . 1
