To open a Photoshop file you can download from this book's companion website, drag the file's icon to your desktop or to a folder location in the Explorer window. You may need to rename the file to.psd. Covering the Basics To start working in Photoshop, you must begin with a new, blank file. First, choose Application⇒New. In the New dialog box that appears, select a File Type of Photoshop (PSD) to create a new file (that is, a Photoshop Document or file with Photoshop extension). The extension you choose is referred to as a "file type." You may also need to select a resolution (in pixels) as well. Click Create. A new file appears in the Library/Content window with the file name — say, YourFilenameHere.psd. In the Library/Content window, you see that a new folder icon has appeared near the top of the window with the same name as the filename you entered. You need to save this file to the local hard drive as well as create a spot in the hard drive to store the file. To save a new file, choose File⇒Save or press Ctrl+S (⌘-S on the Mac). You see the Save As dialog box, which allows you to name and save the file with a different extension from.psd (for example.jpg). If you prefer, you can use the File⇒Save as Type menu to choose a different type of file from the other choices. Choose Save. The folder icon disappears from the Library/Content window, and your file appears in the folder you created. If you don't save the file right away, you can always add it to the folder later.

Photoshop has many tools that allow you to edit, crop, or resize your image. Just be sure to read the Help screen when using a new tool. Selecting from the toolbox automatically places the tool in the tool bar, and the tool's menu is often right-aligned at the top of the screen. (The basic operation of tools is covered in the upcoming sections "Creating a New Layer" and "Composing a New Document.") The palette can be accessed by choosing Window⇒Palettes. Click the button for a specific tool to highlight it. This feature saves you from having to scroll through menus. If you scroll to the right, you see a list of tools and menus, and select the tool you want

Resizing: The most powerful tool in Photoshop is the Resize tool. You can resize any object in any size. It can be used to increase or decrease the size of an image, a shape or create a new image. You can also edit the width and height of the image that is being resized. A proportion of your edit in each direction will be maintained in the new size. Let's say, you have a 3x5 inch picture and want to increase the size to 5x7 inch. The first step you can take to resize the image is to double click the Resize tool button on the toolbar of Photoshop. Then drag the handles that are present in the bottom right corner of the image window to the desired size. To resize the image, move the handles above the image and drag the handles toward the center of the image. To resize the image, simply click on any corner of the image window. 2. As enterprises continue to move toward a software-defined networking (SDN) platform, there are some questions that are not as straightforward as one would expect. And that's not surprising. As they change and evolve, networks have a habit of changing as well. When you first get into this space, you start wondering what it is, why it is, and what you can do with it. One of the main questions in the early stages of this journey is: "What is SDN?" In order to understand SDN, it's important to know what SDN is not. It is not virtualization of the network. It is not about moving everything into virtual machines. It's not about having a network cloud. It's not about the graph, the intent, or the content. It's not about the backbones of the network. SDN is about visibility. It is about visibility into the network's operations. There are many definitions of SDN, and they vary. Another is, SDN is network infrastructure that is decoupled from the processing of network traffic. As a network becomes software defined, it is decoupled from the traditional infrastructure. In the past, as we've seen, networks were given names. They were given a name with the network name space. When a network needed to be re-provisioned, it was re-provisioned by changing the name of the network, and bringing in a new network into the active space. This used to happen on a regular basis. Now, with SDN, we move things outside the traditional confines. We have a
