While Photoshop is considered a powerful photo manipulation tool, it's far from the only tool that does the job. Many other programs include similar editing tools such as FotoMagico or Adobe Elements, and many offer additional features such as anti-aliasing or the ability to create an alpha channel. Image Quality Many people new to photography are under the impression that the higher the resolution the better the image. However, the quality of an image is more than just the number of pixels in it. For example, if you have a 4,000x4,000 pixel photo that you've made with a 4-megapixel camera, it probably will look great at 3x the size. However, a photo taken at 25 megapixels has huge pixels that will show up in your prints and photos. Few of the photos in this book are going to be shot at the resolution of your HDTV. They were taken with a normal camera, and you can see the effects of resolution on the printouts. In the following sections, we describe some settings that will give you control over the image size and the quality of the image that will be produced. Understanding resolutions When you hold a camera up to your eye, you're seeing an image that's being projected onto your retina at a certain resolution. You can see that resolution in your eye, but you can't see how that image is being projected onto your retina. By the time you look at a printed image, that number is factored in as well. However, a phone, for example, will actually convert your image to the low resolution of its display. So, the size that you see on the phone is much smaller than what your eye can see. Camera cameras have a lens with several different numbers on it that tells you how large the photo you see on the LCD will end up. Some cameras are set up so that you can change the size of the image you see on the LCD without changing the size of the actual photo. Changing the size of your image is also different for digital cameras and phones because the actual lens on your camera and display are different in size. A typical digital camera lens is much smaller than the display you see on your phone, so you can do several things to change the size of the image when you make a photo with your camera. On a digital camera, you can change the size of the image in several ways: You can choose a setting that enlarges or reduces

A multidisciplinary approach to the avoidance of air leaks in pediatric bronchoscopy. Although bronchoscopy is an integral part of pediatric practice, air leaks may complicate any given procedure. The aim of this study was to assess the contribution of the various anesthetic techniques to the prevention of air leaks in pediatric bronchoscopy. This was a retrospective study of bronchoscopy procedures performed at the Children's Hospital of Philadelphia over an 8-year period, with a comparison between two different anesthetic techniques. There were 2,876 procedures recorded in the medical records. As a group, air leaks occurred in 5% of the procedures. Seventy-one percent were spontaneous, and 19% were secondary to airway obstruction. The major concern was occurring during induction of general anesthesia (24% of the episodes), during transport from the operating room to the procedure room (27%), and during the procedure itself (14%). General anesthesia was the only factor associated with an increased incidence of air leak. Its use can be safely limited to cases in which it is indicated. Conversely, there is no evidence to suggest that techniques other than general anesthesia will reduce the incidence of air leak. 1. Field of the Invention The present invention relates to a method of loading and unloading guns, and more particularly, to a method of loading and unloading guns in which an operator hits the shoulder of the gun to unload the last shot after removing the gun barrel from the gun cylinder, thereby reliably unloading the gun. 2. Description of the Related Art Generally, a gun barrel and a gun cylinder are detachable and their connection comprises a coupling means interposed therebetween. When a gun is loaded, a cocking handle is turned to cock (load) the gun. Also, when the cocking handle is released, a trigger of the gun is pulled to fire the gun. To prevent the gun from firing accidentally, a safety lever is attached to the cocking handle and an operator must pull the safety lever before he pulls the trigger. FIG. 1 is a diagram showing a conventional method of loading and unloading a gun. Referring to FIG. 1, a gun cylinder 22 is detachably mounted to a frame 24 which is detachably mounted to an operating stand 20, and a safety lever 26 is attached to a cocking handle 26a of the gun 20. An operator manually presses the safety lever 26 when he desires to load a bullet into the gun, such that the safety lever 26 is rotated about

The present invention relates to a method of manufacturing an electromagnetic wave shielding member made of a conductive plate of a metal such as aluminum, copper or stainless steel and to an electromagnetic wave shielding member manufactured by the method. Recently, a touch panel and a display device provided with the touch panel have been widespread, and the market has been rapidly expanding. This is because the touch panel is a device capable of supporting a variety of input operations of a computer in the same way as a keyboard, a mouse and the like. Such a touch panel is attached on a display panel such as a liquid-crystal display device or a CRT display device. Accordingly, in the construction of a device such as a notebook personal computer, an electronic equipment, an AV equipment, an OA equipments or the like, it is required to attach the touch panel on the display panel. The touch panel or display panel is conventionally constructed by an individual wiring method as shown in FIG. 1. According to this method, first an upper protective glass plate 3 is fixed on a liquid-crystal panel 2 by using double side adhesive tape 1. Then a lower glass plate 4 is fixed on the liquid-crystal panel 2 by using double side adhesive tape 1, and then the above-mentioned touch panel is attached on the liquid-crystal panel 2. According to this construction, however, it is difficult to maintain an excellent shielding effect by an electromagnetic wave leakage prevention member of the liquid-crystal panel 2, and also the maintenance of the whole construction becomes difficult. In order to resolve the problems of the conventional method, there has been proposed a technique wherein the above-mentioned double side adhesive tape 1 is not used, and instead a shielding plate made of a conductive plate is attached on the liquid-crystal panel 2. FIGS. 2A to 2D illustrate an example of an electromagnetic wave shielding member according to the conventional technique. In the drawings, reference numeral 6 denotes a conductive plate made of a metal such as aluminum, copper or stainless steel, and reference numeral 7 denotes a metal layer formed by electro-plating or the like, and the metal layer 7 is generally formed on one surface of the conductive plate 6. Reference numeral 8 denotes a copper sheet arranged in parallel to the conductive plate 6, the copper sheet 8 is formed by punching a plate of copper into a predetermined shape and then bending it into the above-mentioned predetermined shape, or copper foil formed into the above
